Network Security and
Cryptography

Topic 8 – Lecture 1:
Packet Filters & Access Control Lists

V1.0

© NCC Education Limited

Access Control Topic 8 - 8.3

Scope and Coverage

This topic will cover:

- Packet filtering
- Access control lists
- NAT
- IDS

Bringing British
Education to You
www.nccedu.com

V1.0

© NCC Education Limited

Access Control Topic 8 - 8.4

Learning Outcomes

By the end of this topic students will be able to:

- Configure access control mechanisms
- Apply and manage port forwarding rules

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.5

Access Control

- Network traffic is in the form of IP/TCP/UDP packets
- The headers of these packets contain information as to source and destination of the packets
- Routing devices uses the source and destination addresses to route traffic through the network
- These addresses can be used to create access control rules
- We will examine methods for determining if traffic is allowed on a network or section of a network

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.6

Packet Filtering

- Routing devices examine a packet's destination address and decide where to send it
- Packet filtering adds an extra layer to this process
- First the destination address is examined
- If the router determines that it should process the packet it then applies a set of rules to determine what happens to it
- Can apply these rules to both incoming and outgoing packets

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.7

Filtering Rules

- Implement security policies as services that are allowed or disallowed
- Examples:
 - Packets for particular machines can be blocked
 - Specific types of packets can be blocked
 - Packets going out of your network can be blocked
- Packet filtering rules can be very general or can be applied to specific machines or ports

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.8

Use of Packet Filtering

- Commonly used to protect a network from attack from machines outside of the network
- Most routing devices have packet filtering capabilities
- An inexpensive option as no extra equipment required
- Very powerful tool
- Does not provide full protection

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.9

Packet Filtering Possibilities

- Can be applied to:
 - a. Machines
 - b. Ports
 - c. Combinations of machines and ports
- Examples:
 - a. Block all traffic to machine A
 - b. Block all traffic to port 80 (http)
 - c. Block all traffic to port 80 except on machine A

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.10

Stateless Filtering - 1

- Simple rules
- Easy to implement
- Not flexible
- For example:
 - If all traffic to port 80 is blocked a static filter will block all http traffic
 - It cannot be set to block all traffic to port 80 except that from <http://campus.nccedu.com> in a single rule

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.11

Stateless Filtering - 2

- Filtering process is “dumb”
 - Applies a set of static rules to every packet
 - Does not store any results from previous packets
 - No intelligence or learning built into the filtering system
- The set of rules is an **Access Control List (ACL)**
 - Rules are checked in a specific order
 - The first matching rule found is applied to the packet
 - If there are no rules matching the packet is blocked

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.12

Stateful Filtering

- Also known as Dynamic Packet Filtering
- Uses a state table that stores detail of legitimate traffic requests:
 - IP addresses
 - Ports
 - Handshake status
 - Route/Time
- Compare packets with previous valid traffic
- Allows traffic based upon connections

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.13

Configuring Static Packet Filters

- There are three main steps to correctly configuring static packet filters

1. Decide what traffic to permit and what traffic to block
 - Determined by nature of business and assessment of security risks
2. Define this as a set of rules that includes IP addresses and port numbers
3. Translate these rules into a language that the router or other device understands
 - May be vendor specific so we do not cover this

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.14

What is Permitted?

- This is done at a conceptual level
 - Is internet access allowed
 - Can individual machines accept email from the Internet or will it all come through a central mail server
 - Are all messages from a specific location blocked
- A good general rule is to block all packets except those that have been specifically allowed
 - Default is to block all packets not processed by the rule list

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.15

Access Control Lists - 1

- A simple tabular template should be used that has one rule for each line of the table
- The following columns should be included:
 - Source IP address
 - Source port
 - Destination IP address
 - Destination port
 - Action (block/allow)
 - Comments (allow a brief text explanation)
- Protocol can be included in this

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.16

Access Control Lists - 2

- The order of the rules is important
- The first rule that matches with the packet being inspected will be implemented
- All remaining rules will be ignored

Source IP	Source port	Destination IP	Destination port	Action	Comment
81.109.47.141	*			Block	Block all traffic from this
		192.37.22.01	110	Allow	Open internal POP3 port

Bringing British Education to You
 www.nccedu.com

V1.0

© NCC Education Limited

Access Control Topic 8 - 8.17

Access Control Lists - 3

- What happens when 81.109.47.141 sends an email message to 192.37.22.01?
- What happens if 81.109.47.142 sends an email message to 192.37.22.01?
- What happens if 81.109.47.142 sends a telnet message to 192.37.22.01?
- What if the rule order is swapped?

Source IP	Source port	Destination IP	Destination port	Action	Comment
81.109.47.141	*			Block	Block all traffic from this
		192.37.22.01	110	Allow	Open internal POP3 port

Network Security and Cryptography

Topic 8 – Lecture 2:
NAT and IDS

Bringing British Education to You
 www.nccedu.com

V1.0

© NCC Education Limited

Access Control Topic 8 - 8.19

Network Address Translation

- NAT provides a means to connect multiple computers to an IP network using only one IP address
- Three reasons this is useful:
 - Shortage of IP addresses (under IPv4)
 - Security
 - Flexible network administration

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.20

The Number of IP Addresses

- A typical IP address is written as dotted quad
 - E.g. 81.109.47.141
- In IPv4 there was theoretical limit on the number of available IP addresses
 - 4 bytes = 2^{32} = 4,294,967,296 possible addresses
- Method was required to create “extra” IP addresses or the Internet would reach capacity
- The main reason for the use of NAT originally was to create “extra” IP addresses

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.21

The IP Address

- An IP address has two parts:
 - a network number
 - a host number
- Computers on one physical network have the same network number
 - Think street name in a postal address
- The rest of the IP address defines an individual computer
 - Think house number in a postal address

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.22

IP Address Classes - 1

- The network size determines the class of IP address
- There is a network and host part in each IP address
- IP addresses come in 4 classes (A, B, C and D)
- Each class suits a different network size

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.23

IP Address Classes - 2

- Network addresses with first byte between 1 and 126 are class A with approx. 17 million hosts each
- Network addresses with first byte between 128 and 191 are class B with approx. 65000 hosts each
- Network addresses with first byte between 192 and 223 are class C with 256 hosts
- All other networks are class D, used for special functions, or class E which is reserved

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.24

Dynamically Assigning Addresses

- Internet Service Providers (ISPs) usually allocate a single address to a single customer
- This is assigned dynamically
 - every time a client connects to the ISP a different address is provided
- Large companies can buy several addresses
- It is more economic for small businesses to use a single address

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.25

Connecting Multiple Computers

- In theory one IP address means only one computer can connect to the Internet
- By using a NAT gateway running on a single computer, multiple local computers can connect using the single IP address
- To the Internet this appears as a single computer
- End-to-end connections are not created and this can prevent some protocols from working

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.26

Dynamic NAT

- A small number of public IP addresses are dynamically assigned to a large number of private IP addresses
- Port Address Translation (PAT) is a variant of NAT:
 - Allows one or more private networks to share a single public IP address
 - Commonly used in small businesses
 - Remaps both source and destination addresses and source and destination ports of packets

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.27

NAT and Security

- NAT only allows connections that come from inside the network
- Internal servers can allow connections from outside via inbound mapping
 - Specific ports are mapped to specific internal addresses
 - Makes services such as FTP or the Internet available but in a highly controlled way
- NATs use their own protocol stack not that of the host machine
 - Protects against some attacks

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.28

NAT and Network Administration

- Can aid network administration in several ways:
 - May contain a dynamic host configuration protocol (DHCP) server
 - Provide methods for restricting Internet access
 - Have traffic logging capabilities
 - Can divide a network into sub-networks

Bringing British Education to You
www.nccedu.com

V1.0

© NCC Education Limited

Access Control Topic 8 - 8.29

NAT Operation

- Changes the source address on every outgoing packet to the single public address
- Renumbers source ports to be unique
 - Used to keep track of each client connection
- Has a port mapping table to record ports for each client computer
 - Relates real local IP address and source port to translated port number, destination address and port
 - Allows the process to be reversed for incoming packets so they are routed to the correct client

Access Control Topic 8 - 8.31

Intrusion Detection Systems (IDS)

- Monitors network traffic for suspicious activity
- Alerts the network administrator if suspicious activity discovered
- May also respond to suspicious traffic by:
 - blocking the user from accessing the network
 - blocking the IP address from accessing the network
- Different types that use different methods to detect suspicious activity

V1.0 NCC Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.32

IDS Types

- Network based intrusion detection systems (NIDS)
- Host based intrusion detection systems (HIDS)
- IDS that look for signatures of known threats
- IDS that compare traffic patterns against a network baseline and look for anomalies in the patterns

V1.0 NCC Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.33

NIDS

- Positioned in strategic locations in the network
- Monitor all traffic to and from network devices
- In a perfect world all traffic would be monitored
- This would create a bottleneck in the network with a huge processing overhead
 - It would deteriorate network speed

V1.0 NCC Bringing British Education to You www.nccedu.com © NCC Education Limited

Access Control Topic 8 - 8.34

HIDS

- Operate on individual hosts or network devices
- Monitors all inbound and outbound packets but only to and from the device it operates on
- If suspicious activity is detected it usually alerts the user and/or network administrator of that activity

 Bringing British Education to You
www.nccedu.com

V1.0 © NCC Education Limited

Access Control Topic 8 - 8.35

Signature-based IDS

- Monitors packets on the network
- Compare packets against a stored database of known malicious threats
 - Similar to the operation of antivirus software
- When a new threat appears there is a period of time before this is added to the database
- Any new threat is undetected until such time as the database is updated to include this threat
 - Similar to the operation of antivirus software

 Bringing British Education to You
www.nccedu.com

V1.0 © NCC Education Limited

Access Control Topic 8 - 8.36

Anomaly-based IDS

- Monitors network traffic
- Compare network traffic with a baseline
- Baseline is "normal" traffic for that network:
 - Bandwidth
 - Protocols
 - Ports
 - Devices
- User and/or network administrator is alerted if there is a significant change from the baseline

 Bringing British Education to You
www.nccedu.com

V1.0 © NCC Education Limited

Access Control Topic 8 - 8.37

IDS Overview

- Ideal for monitoring and protecting a network
- Can be prone to false alarms
- Must be correctly set up to recognize what is normal traffic on the network
- Network administrators and users must:
 - Understand the alerts
 - Know the most effective course of action upon receiving an alert
