Cryptography

Topic 9 – Lecture 1:
Firewall Operation

V1.0

© NCC Education Limited

Firewalls Topic 9 - 9.3

Scope and Coverage

This topic will cover:

- Firewall architectures and their limitations
- The DMZ firewall and its limitations

Bringing British
Education to You
www.nccedu.com

V1.0

© NCC Education Limited

Firewalls Topic 9 - 9.4

Learning Outcomes

By the end of this topic students will be able to:

- Describe the components of a firewall
- Configure a DMZ firewall
- Evaluate the limitations of firewalls

Firewalls Topic 9 - 9.5

Network Firewall

- A firewall is the first line of defence for your network
- The purpose of a firewall is to keep intruders from gaining access to your network
- Usually placed at the perimeter of network to act as a gatekeeper for incoming and outgoing traffic
- It protects your computer from Internet threats by erecting a virtual barrier between your network or computer and the Internet

 Bringing British Education to You
www.nccedu.com

V1.0 © NCC Education Limited

Firewalls Topic 9 - 9.6

How Does a Firewall Work?

- Examines the traffic sent between two networks
 - e.g. examines the traffic being sent between your network and the Internet
- Data is examined to see if it appears legitimate:
 - if so the data is allowed to pass through
 - If not, the data is blocked
- A firewall allows you to establish certain rules to determine what traffic should be allowed in or out of your private network

 Bringing British Education to You
www.nccedu.com

V1.0 © NCC Education Limited

Firewalls Topic 9 - 9.7

Creating Rules

- Traffic blocking rules can be based upon:
 - Words or phrases
 - Domain names
 - IP addresses
 - Ports
 - Protocols (e.g. FTP)
- While firewalls are essential, they can block legitimate transmission of data and programs

V1.0 NCC Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.8

Common Firewall Types

- In general there are software firewalls and hardware firewalls
 - Even in home networks
- Hardware firewalls are typically found in routers, which distribute incoming traffic from an Internet connection to computers
- Software firewalls reside in individual computers
- Ideally a network has both

V1.0 NCC Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.9

Software Firewall

- Protect only the computer on which they are installed
- Provide excellent protection against threats (viruses, worms, etc.)
- Have a user-friendly interface
- Have flexible configuration

V1.0 NCC Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.10

Router Firewall

- Protect your entire network or part of a network
- Located on your router
- Protect network hardware which cannot have a software firewall installed on it
- Allows the creation of network-wide rules that govern all computers on the network

 Bringing British Education to You
www.nccedu.com

V1.0 © NCC Education Limited

Firewalls Topic 9 - 9.11

Firewall Operation

- Can be divided into three main methods:
 - Packet filters (see last topic)
 - Application gateways
 - Packet inspection
- Individual vendors of firewalls may provide additional features
 - You should look at their products for details

 Bringing British Education to You
www.nccedu.com

V1.0 © NCC Education Limited

Firewalls Topic 9 - 9.12

Application Gateways

- Application-layer firewalls can understand the traffic flowing through them and allow or deny traffic based on the content
- Host-based firewalls designed to block objectionable Web content based on keywords are a form of application-layer firewall
- Application-layer firewalls can inspect packets bound for an internal Web server to ensure the request isn't really an attack in disguise

 Bringing British Education to You
www.nccedu.com

V1.0 © NCC Education Limited

Firewalls Topic 9 - 9.13

Advantages of Application Gateways

- Provide a buffer from port scans and application attacks
 - if an attacker finds a vulnerability in an application, the attacker would have to compromise the application/proxy firewall before attacking devices behind the firewall
- Can be patched quickly in the event of a vulnerability being discovered
 - This may not be true for patching all the internal devices

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.14

Disadvantages

- Needs to know how to handle traffic to and from your specific application
 - If you have an application that's unique, your application layer firewall may not be able to support it without making some significant modifications
- Application firewalls are generally much slower than packet-filtering or packet-inspection firewalls
 - They run applications, maintain state for both the client and server, and also perform inspection of traffic

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.15

Packet Inspection Firewalls

- Examine the session information between devices:
 - Protocol
 - New or existing connection
 - Source IP address
 - Destination IP address
 - Port numbers
 - IP checksum
 - Sequence numbers
 - Application-specific information

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.16

Outbound Internet Traffic

- Client initiates connection to IP address of the web server destined for port 80 (HTTP)
- Firewall determines whether that packet is allowed through the firewall based on the current rule-set
- Firewall looks into the data portion of the IP packet and determine whether it is legitimate HTTP traffic
- If all the requirements are met, a flow entry is created in the firewall based on the session information, and that packet is allowed to pass

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.17

Inbound Internet Traffic

- Web server receives the packet and responds
- Return traffic is received by the firewall
- Firewall determines if return traffic is allowed by comparing the session information with the information contained in the local translation table
- If return traffic matches the previous requirements, payload is inspected to validate appropriate HTTP
- Then it is forwarded to the client

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.18

Advantages

- Generally much faster than application firewalls
 - They are not required to host client applications
- Most of the packet-inspection firewalls today also offer **deep-packet inspection**
 - The firewall can dig into the data portion of the packet and also:
 - Match on protocol compliance
 - Scan for viruses
 - Still operate very quickly

V1.0  Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.19

Disadvantages

- Open to certain denial-of-service attacks
- These can be used to fill the connection tables with illegitimate connections

Network Security and Cryptography

Topic 9 – Lecture 2:
Firewall Architecture

V1.0

© NCC Education Limited

Firewalls Topic 9 - 9.21

Firewall Architecture

- Firewalls are used to protect the perimeter of a network and the perimeter of sections of networks
- A key question for a network administrator is where firewalls should be located
- The positioning of firewalls in relation to other network elements is the firewall architecture
- We will only look at the position of firewalls and the consequences of this
 - Other security devices should also be used

Bringing British Education to You
www.nccedu.com

V1.0

© NCC Education Limited

Firewalls Topic 9 - 9.22

Firewall Architecture

- The following are common firewall architectures:
 - Screening router
 - Screened host
 - Dual homed host
 - Screened subnet
 - Screened subnet with multiple DMZs
 - Dual firewall

Bringing British Education to You
www.nccedu.com

V1.0

© NCC Education Limited

Firewalls Topic 9 - 9.23

Screening Router

- Simplest of firewall architectures
- Traffic is screened by a router
 - Packet filtering
 - Using ACLs
- Traffic is screened according to:
 - Source or destination IP address
 - Transport layer protocol
 - Services requested

Bringing British Education to You
www.nccedu.com

V1.0

© NCC Education Limited

Firewalls Topic 9 - 9.24

Screening Router

- Usually deployed at the perimeter of the network
- May be used to control access to a Demilitarized Zone (DMZ) – see later
- More often used in conjunction with other firewall technologies

```
graph LR; UN[Untrusted Network] --- PF[Packet Filter]; PF --- TN[Trusted Network]
```

Bringing British Education to You

V1.0

© NCC Education Limited

Firewalls Topic 9 - 9.25

Advantages & Disadvantages

- Advantages
 - Simple
 - Cheap
- Disadvantages
 - No logging
 - No user authentication
 - Difficult to hide internal network structure

Bringing British Education to You
www.nccedu.com

V1.0

© NCC Education Limited

Firewalls Topic 9 - 9.26

Demilitarised Zones (DMZ)

- A DMZ is part of the internal network but separated from the rest of the internal network
- Traffic moving between the DMZ and other interfaces on the protected side of the firewall still goes through the firewall
- This traffic has firewall protection policies applied
- Common to put public-facing servers on the DMZ:
 - Web servers
 - Email servers

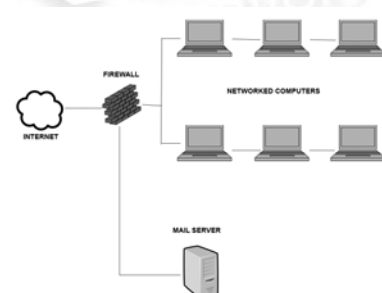

Bringing British Education to You
www.nccedu.com

Firewalls Topic 9 - 9.27

Demilitarised Zones (DMZ)

The diagram illustrates a network architecture. On the left, a cloud icon labeled 'INTERNET' is connected to a central 'FIREWALL' icon. To the right of the firewall, there are two groups of computer icons: the top group is labeled 'NETWORKED COMPUTERS' and the bottom group is labeled 'MAIL SERVER'. Both the 'NETWORKED COMPUTERS' and 'MAIL SERVER' are connected to the 'FIREWALL'.

V1.0

© NCC Education Limited

Firewalls Topic 9 - 9.28

Screened Host Firewall

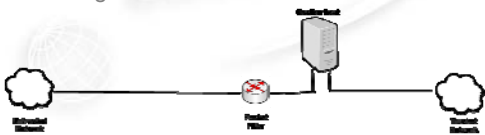

- Adds an extra layer of protection in comparison to a screening router
- Has a Bastion Host/Firewall between networks
- Bastion Host/Firewall has two NICs
- Bastion Host/Firewall connects the trusted network to the untrusted network
 - Stateful and proxy technologies are used to filter traffic up to the application layer

V1.0 NCC Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.29

Bastion Host

- A special purpose computer specifically designed and configured to withstand attacks

- The router is the first line of defence
 - packet filtering/access control is carried out at the router
- The bastion host is the server that connects to the unsecure network through the router

V1.0 NCC Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.30

Advantages & Disadvantages

- Advantages
 - Security is distributed between two points
 - Greater security than screening router
 - Transparent outbound access/restricted inbound access
- Disadvantages
 - Difficult to hide internal structure
 - There is a single point of failure in the network

V1.0 NCC Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.31

Dual-Homed Host

- A Bastion Host/Firewall is surrounded with packet filtering routers
 - Dual-homed - outside world and protected network
 - Multi-homed - outside world and multiple protected networks
- Routers filter traffic to the Bastion Host
- Bastion Host adds additional filtering capabilities
- Bastion Host has no routing capabilities

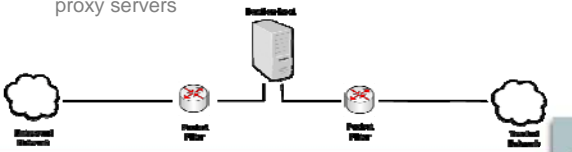

Bringing British Education to You
www.nccedu.com

© NCC Education Limited

Firewalls Topic 9 - 9.32

Advantages & Disadvantages

- Advantages
 - Hides internal network structure
- Disadvantages
 - Requires users to log onto bastion host or the use of proxy servers

Bringing British Education to You
www.nccedu.com

© NCC Education Limited

Firewalls Topic 9 - 9.33

Screened Subnet DMZ

- Bastion Host is surrounded with packet filtering routers
- These control traffic into and out of the trusted and untrusted network sections
- Has an extra layer of functionality with a DMZ
- Traffic from DMZ to trusted network must go through Bastion Host and packet filtering router

Bringing British Education to You
www.nccedu.com

© NCC Education Limited

Firewalls Topic 9 - 9.34

Advantages & Disadvantages

- Advantages
 - Provides services to outside without compromising inside
 - Internal network hidden
- Disadvantages
 - Single point of failure

V1.0 NCC Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.35

Screened Subnet Multiple DMZs

- Allows configuration of varying levels of security between:
 - DMZs and the untrusted network
 - Different DMZs
 - DMZs and the trusted network

V1.0 NCC Bringing British Education to You www.nccedu.com © NCC Education Limited

Firewalls Topic 9 - 9.36

Dual Firewall Architecture

- Using two or more firewalls enhances security
- Can be used to create DMZs
- Using technology from multiple vendors can enhance security

V1.0 NCC Bringing British Education to You www.nccedu.com © NCC Education Limited
